

The Non-Separable Case

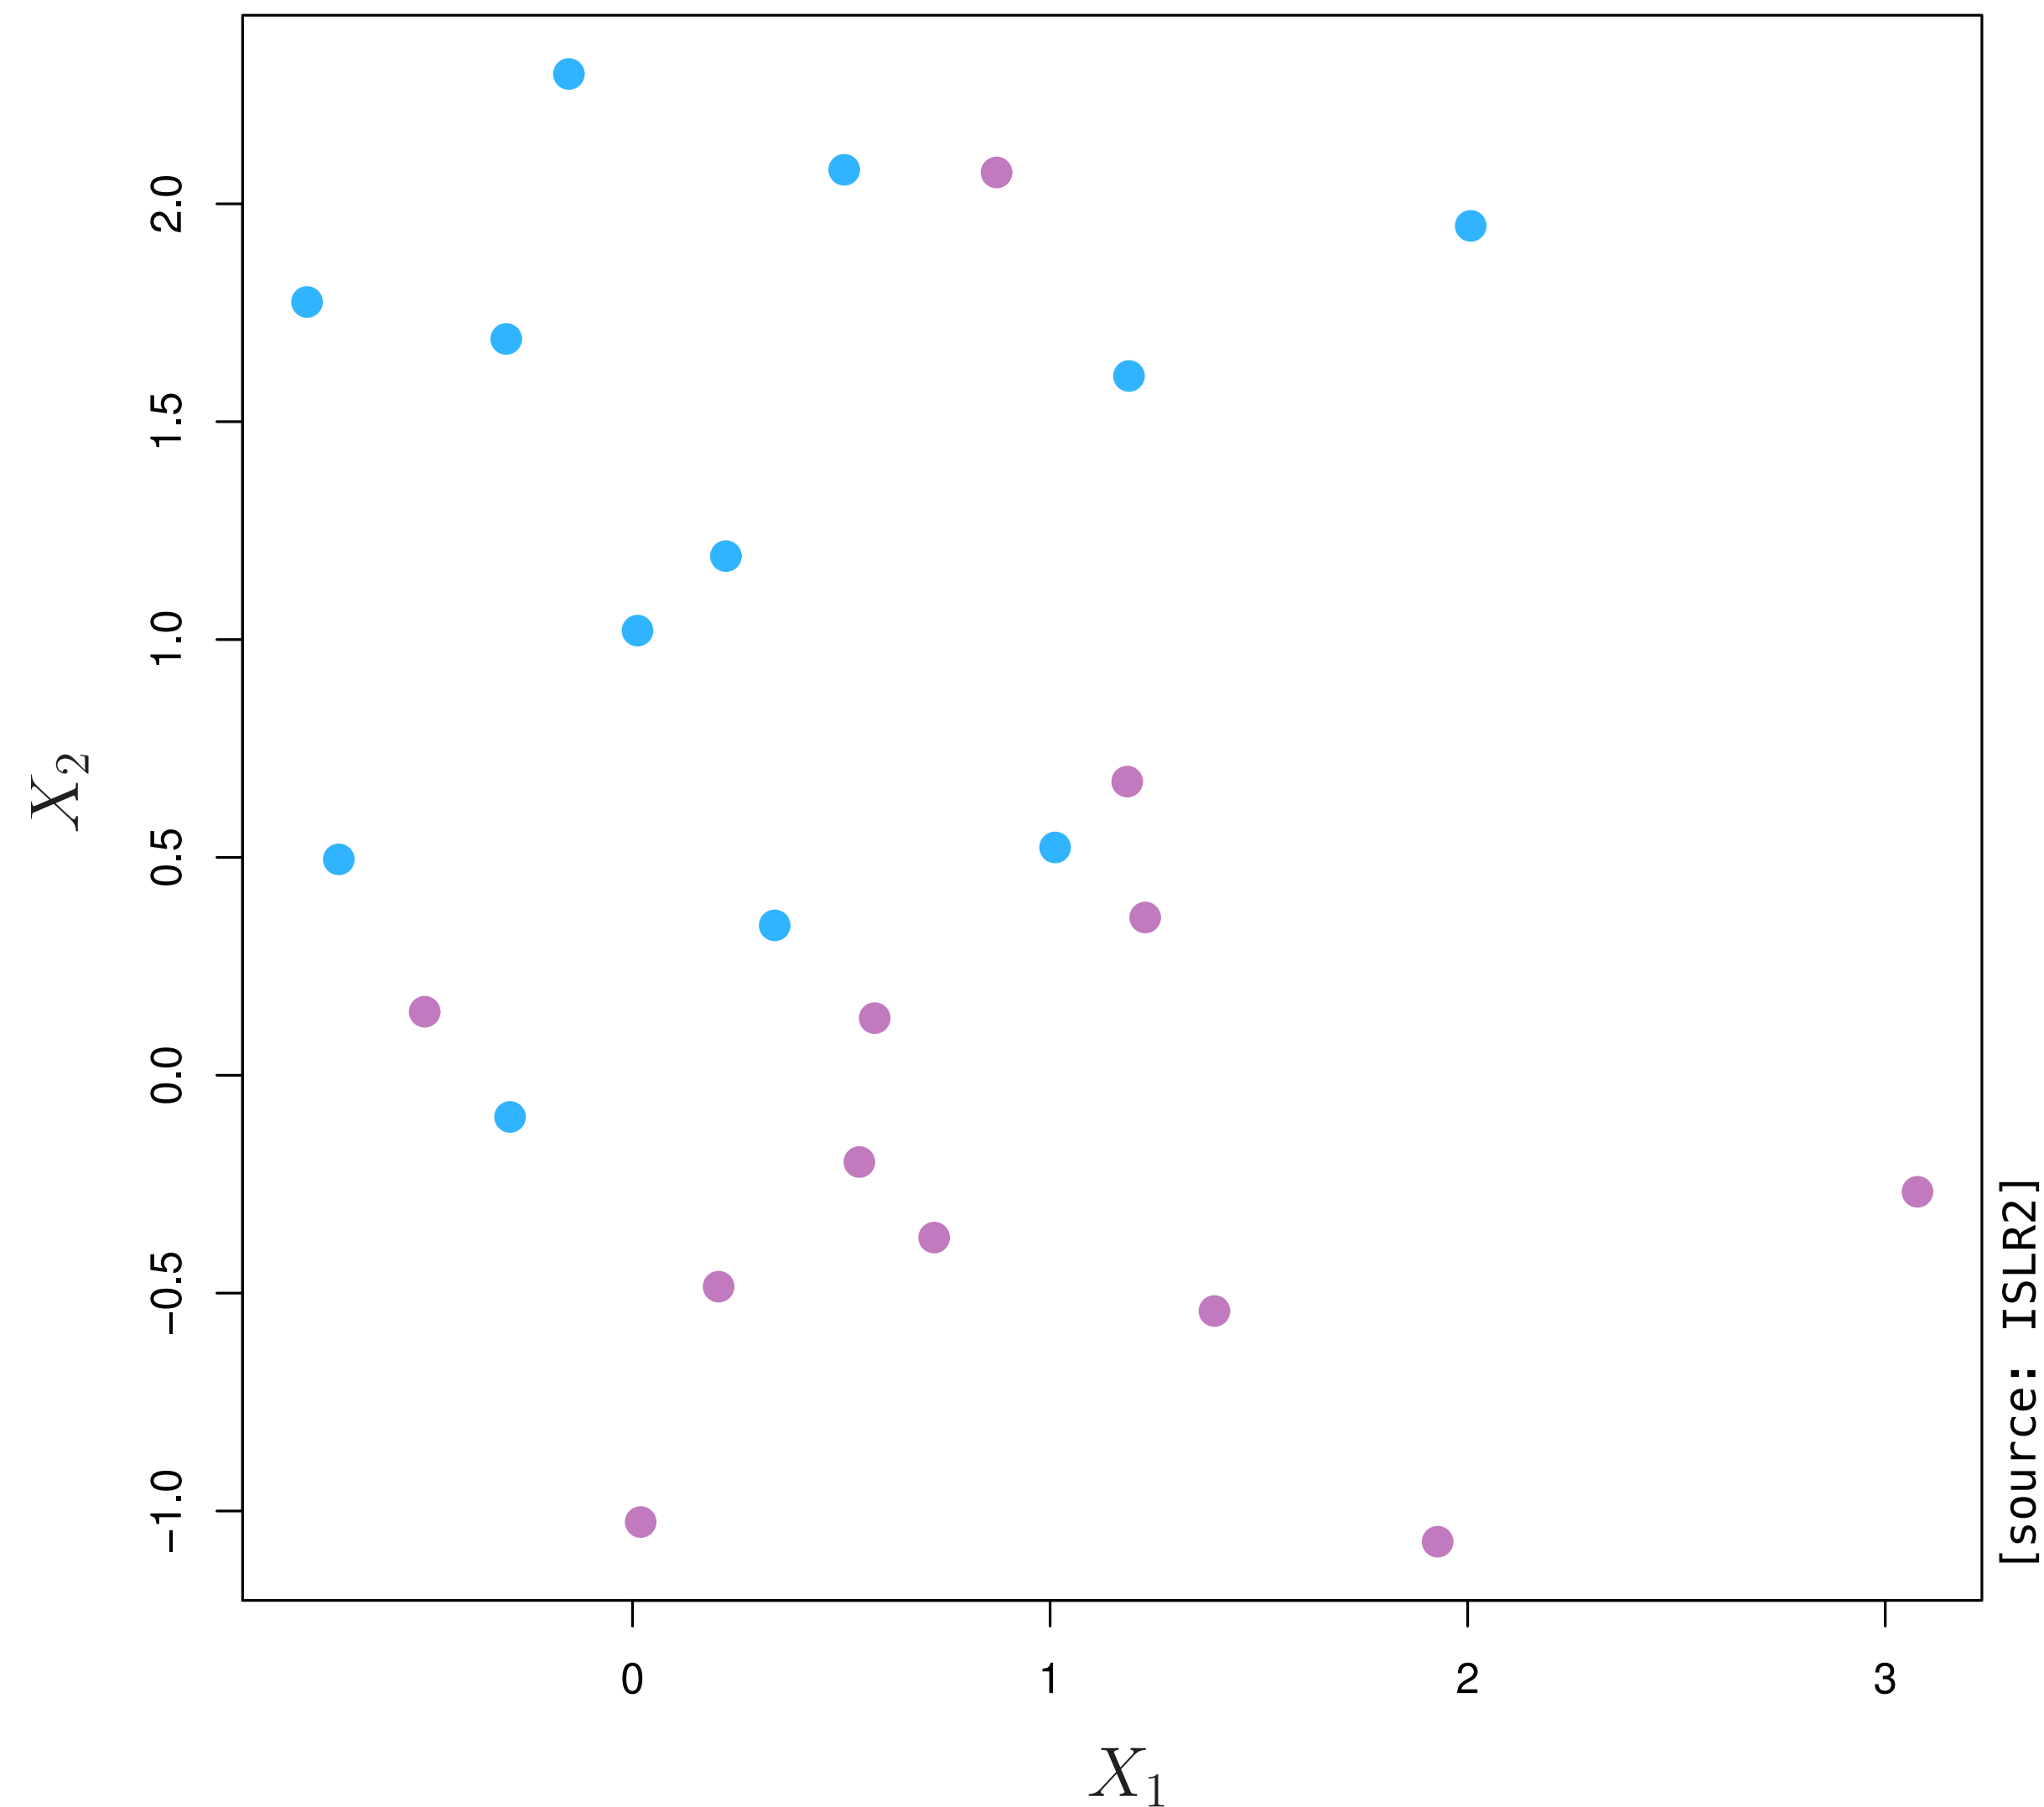

the optimization problem for the maximal margin classifier often has no solution with $M \geq 0$

and it's very sensitive to outliers!

The Non-Separable Case

the optimization problem for the maximal margin classifier often has no solution with $M > 0$

and it's very sensitive to outliers!

The Non-Separable Case

even if the data are separable, they are sometimes noisy

\Rightarrow poor solution for the maximum margin classifier
