

Backpropagation

$$h = w_1 \cdot x + b_1$$

$$g = w_2 \cdot x + b_2$$

how close is g to our
actual value?

Loss function (MSE):

$$\frac{1}{N} \sum_i^N (y_i - g_i)^2 \implies \frac{1}{N} \sum_i^N (y_i - \underbrace{(w_2 \cdot (w_1 \cdot x_i + b_1))}_{= h} + b_2)^2$$

Backpropagation

$$\frac{1}{N} \sum_i^N (y_i - g_i)^2 \implies \frac{1}{N} \sum_i^N \underbrace{(y_i)}_{\text{actual}} - \underbrace{(w_2 \cdot (w_1 \cdot x_i + b_1) + b_2)}_{\text{predicted}})^2$$

this is what the
gradient tells us!

How change w_1 to reduce our loss?
How change w_2 to reduce our loss?
How change b_1 to reduce our loss?
How change b_2 to reduce our loss?
