

the Jacobian

- The Jacobian matrix is a matrix of all first-order partial derivatives of a vector-valued function. It generalizes the concept of a derivative to multiple variables and dimensions.
- Measures how a function transforms space:
It describes the local scaling, rotation, or shearing of a function.
- Useful in nonlinear transformations
- The Jacobian determinant represents the factor by which the transformation stretches or squishes the n —dimensional volumes around a certain input.

linear and non-linear transformation
