

some continuous random variables and their pdfs

exponential distribution $X \sim \text{Exp}(\lambda)$

some continuous random variables and their pdfs

exponential distribution $X \sim \text{Exp}(\lambda)$

A continuous random variable X has exponential distribution with parameter λ , for some $\lambda > 0$, if it has the following pdf

$$f(x) = \begin{cases} \lambda e^{-\lambda x} & \text{if } x > 0 \\ 0 & \text{otherwise} \end{cases}$$

and the following cdf

$$F(x) = \begin{cases} 1 - e^{-\lambda x} & \text{if } x > 0 \\ 0 & \text{otherwise} \end{cases}$$

This distribution is memoryless i.e.

$$P(X \geq a | X \geq b) = P(X \geq a - b)$$

The exponential distribution is a specific version of gamma family distributions...

some continuous random variables and their pdfs

gamma distribution $X \sim \text{Gamma}(\alpha, \beta)$

$$\alpha = 1 \implies \text{Exponential} \left(\beta = \frac{1}{\lambda} \right)$$

$$\alpha = \frac{v}{2}, \beta = 2 \implies \text{chi-square } \chi^2(v)$$
