

# Model Selection Criteria

...and compared to cross validation

[Source: ISLR2]

# Model Search Methods

## Best Subset Selection

1. Let  $M_0$  denote null model which contains no predictors. This model simply predicts the of the response for each observation.
2. For  $k = 1, 2, \dots, p$ 
  - Fit all  $\binom{p}{k}$  models that contain exactly  $p$  predictors
  - Pick the best among these  $\binom{p}{k}$  models and call it  $M_k$ .

Here, *best* is defined as having the smallest RSS or largest  $R^2$
3. Select a single best model from among  $M_0, M_1, \dots, M_p$  using cross validated prediction error,  $C_p$  (*AIC*), *BIC*, or Adjusted- $R^2$

requires training  $2^p$  models

## Example

$p = 3$

$M_0$  : intercept only (null)

$C_1$ :  $\bigcirc X_1$   $\bigcirc X_2$   $\bigcirc X_3$

lowest training RSS within  $C_1$

$\Rightarrow M_1$

$C_2$ :  $\bigcirc X_1, X_2$   $\bigcirc X_1, X_3$   $\bigcirc X_2, X_3$

lowest training RSS within  $C_2$

$\Rightarrow M_2$

$M_3$  : full model with

$\bigcirc X_1$   $\bigcirc X_2$   $\bigcirc X_3$
