

on first proof (by contradiction)

even

odd

For all

if

then

our first proof (by construction)

Theorem

For all integers n , if n is even, then n^2 is even.

- Find the **formal definitions** for any terms in the theorem:
 - an integer n is called **even** if there is an integer k where $n = 2k$
 - an integer n is called **odd** if there is an integer k where $n = 2k + 1$
- What is the grammatical structure of the theorem?
 - **For all** integers n , **if** n is even, **then** n^2 is even.

our first proof (by construction)

Theorem

For all integers n , if n is even, then n^2 is even.
