

linear combinations

linear combinations

Let A denote the matrix whose columns are the vectors $\vec{v}_1, \vec{v}_2, \dots, \vec{v}_n$.

Expressing $\vec{v} = x_1 \vec{v}_1 + x_2 \vec{v}_2 + \dots + x_n \vec{v}_n$ as a linear combination of the given vectors is then equivalent to solving the linear system $Ax = \vec{v}$.

- Determining whether a given vector is in the linear span of a given set of vectors, and finding coefficients for linear combinations essentially means solving a system of linear equations (*we'll return to this later*)
- Because of the rules of vector addition, any such linear combination will be in the vector space.
