

mean value then generalized

slope of the tangent line

slope of the secant line between
 $x = a$ and $x = b$

this is the idea behind Taylor's Theorem and using polynomials to approximate a smooth function

mean value theorem generalized

Suppose $f(x)$ is a continuous function on closed interval $[a, b]$ and is differentiable on the interval's interior (a, b) at which a point c exists such that

$$\text{slope of the tangent line} \rightarrow f'(c) = \frac{f(b) - f(a)}{b - a} \leftarrow \text{slope of the secant line between } x = a \text{ and } x = b$$

we can re-write the above equation as

$$\begin{aligned} f(b) &= f(a) + f'(c)(b - a) \\ &\approx f(a) + f'(a)(b - a) \end{aligned}$$

this looks very much like the linear approximation for $f(b)$ using the tangent line at $x = a$

this is the idea behind Taylor's Theorem and using polynomials to approximate a smooth function

Taylor's theorem

Taylor polynomial

Taylor polynomial of degree n
