

Ridge vs. Lasso Regression

Ridge

- + Reduces Multicollinearity
- + Continuous Shrinking
- + Stable Solutions
- + Computationally Efficient
- No variable selection
- Interpretability
- Sensitive to scale

Lasso

- + Variable selection
- + Sparse models
- + Improves interpretability
- + Particularly useful for when $p > n$
- Collinearity issues
- Bias in coefficients (ℓ_1 penalty is harsher)
- Computationally intensive

λ Tuning

- K -fold Cross Validation
 1. Choose the number of folds K
 2. Split the data accordingly into training and testing sets.
 3. Define a grid of values for λ
 4. For each λ , calculate the validation MSE within each fold
 5. For each λ , calculate the overall cross-validation MSE
 6. Locate under which λ cross-validation MSE is minimized, i.e. **minimum_cv** λ
- Packages such as `glmnet` do this automatically
