

example (cont'd...)

discrete random variables: probability mass function

discrete random variables: probability mass function

example (cont'd...)

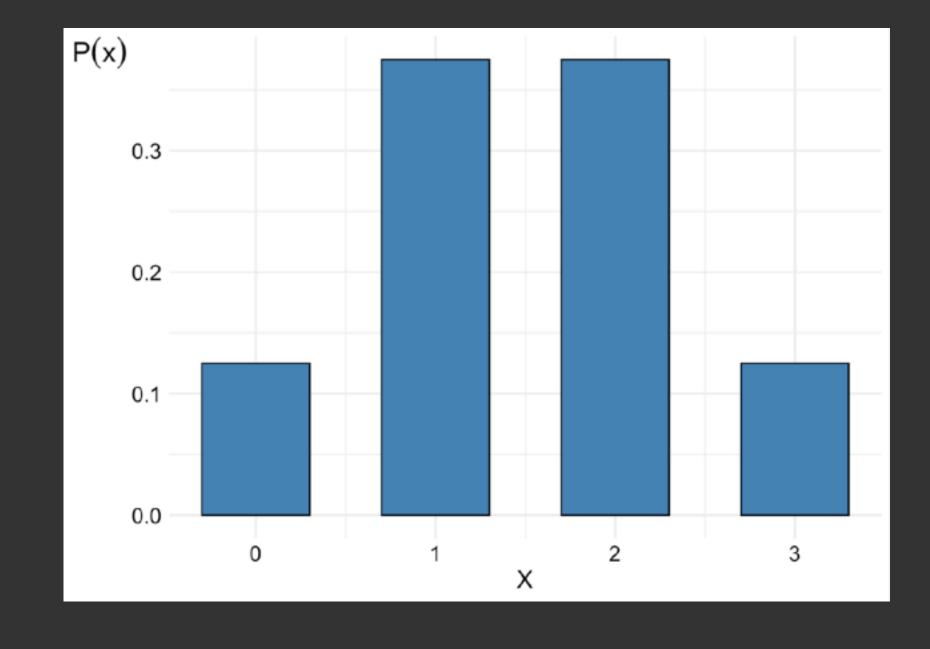

Toss a coin 3 times: the sample space is Ω : {H,T} × {H,T} × {H,T}

Define the random variable: X =the number of heads

What is the probability distribution of X?

\mathcal{X}	f(x) = P(X = x)
0	1/8
1	3/8
2	3/8
3	1/8

This function can be written as:
$$f(x) = \frac{4 - |3 - 2x|}{8}$$

expected value

The expected value, is the (probability) weighted average of the possible outcomes

$$E(X) = \sum_{x} x \cdot P(X = x)$$

the center of gravity of the PMF
