## Polynomial Regression Models

## Polynomial Regression Models

in general, polynomial models are of the form

$$Y = \beta_0 + \beta_1 X + \beta_2 X^2 + \beta_3 X^3 + \dots + \beta_n X^n + \epsilon$$

where d is called the **degree** of the polynomial

- non-linear relationship between predictors and response captured by polynomial terms but model remains linear in the parameters
- example: model can be written as

$$Y=\beta_0+\beta_1X_1+\beta_2X_2+\beta_3X_3+\epsilon$$
 where  $X_1=X,~X_2=X^2,~X_3=X^3$ 

we can use LS for estimation
